

## E. Sum Queries?

time limit per test: 2 seconds  
 memory limit per test: 256 megabytes  
 input: standard input  
 output: standard output

Let's define a *balanced* multiset the following way. Write down the sum of all elements of the multiset in its decimal representation. For each position of that number check if the multiset includes at least one element such that the digit of the element and the digit of the sum at that position are the same. If that holds for every position, then the multiset is *balanced*. Otherwise it's *unbalanced*.

For example, multiset  $\{20, 300, 10001\}$  is *balanced* and multiset  $\{20, 310, 10001\}$  is *unbalanced*:

$\begin{array}{r} 10321 \\ \underline{10001} \\ 300 \\ \underline{20} \end{array}$	$\begin{array}{r} 10331 \\ \underline{10001} \\ 310 \\ \underline{20} \end{array}$
--	--

The red digits mark the elements and the positions for which these elements have the same digit as the sum. The sum of the first multiset is 10321, every position has the digit required. The sum of the second multiset is 10331 and the second-to-last digit doesn't appear in any number, thus making the multiset *unbalanced*.

You are given an array  $a_1, a_2, \dots, a_n$ , consisting of  $n$  integers.

You are asked to perform some queries on it. The queries can be of two types:

- 1  $i$   $x$  — replace  $a_i$  with the value  $x$ ;
- 2  $l$   $r$  — find the *unbalanced* subset of the multiset of the numbers  $a_l, a_{l+1}, \dots, a_r$  with the minimum sum, or report that no *unbalanced* subset exists.

Note that the empty multiset is *balanced*.

For each query of the second type print the lowest sum of the *unbalanced* subset. Print -1 if no *unbalanced* subset exists.

### Input

The first line contains two integers  $n$  and  $m$  ( $1 \leq n, m \leq 2 \cdot 10^5$ ) — the number of elements in the array and the number of queries, respectively.

The second line contains  $n$  integers  $a_1, a_2, \dots, a_n$  ( $1 \leq a_i < 10^9$ ).

Each of the following  $m$  lines contains a query of one of two types:

- 1  $i$   $x$  ( $1 \leq i \leq n, 1 \leq x < 10^9$ ) — replace  $a_i$  with the value  $x$ ;
- 2  $l$   $r$  ( $1 \leq l \leq r \leq n$ ) — find the *unbalanced* subset of the multiset of the numbers  $a_l, a_{l+1}, \dots, a_r$  with the lowest sum, or report that no *unbalanced* subset exists.

It is guaranteed that there is at least one query of the second type.

### Output

For each query of the second type print the lowest sum of the *unbalanced* subset. Print -1 if no *unbalanced* subset exists.

### Example

input	Copy
4 5 300 10001 20 20 2 1 3 1 1 310	

### Educational Codeforces Round 72 (Rated for Div. 2)

#### → Virtual participation

Virtual contest is a way to take part in past contest, as close as possible to participation on time. It is supported only ICPC mode for virtual contests. If you've seen these problems, a virtual contest is not for you - solve these problems in the archive. If you just want to solve some problem from a contest, a virtual contest is not for you - solve this problem in the archive. Never use someone else's code, read the tutorials or communicate with other person during a virtual contest.

[Start virtual contest](#)

#### → Practice

You are registered for practice. You can solve problems unofficially. Results can be found in the contest status and in the bottom of standings.

#### → Clone Contest to Mashup

You can clone this contest to a mashup.

```
2 1 3
2 3 3
2 3 4
```

**output**

Copy

```
-1
330
-1
40
```

**Note**

All the subsets of multiset  $\{20, 300, 10001\}$  are *balanced*, thus the answer is  $-1$ .

The possible *unbalanced* subsets in the third query are  $\{20, 310\}$  and  $\{20, 310, 10001\}$ .

The lowest sum one is  $\{20, 310\}$ . Note that you are asked to choose a subset, not a subsegment, thus the chosen elements might not be adjacent in the array.

The fourth query includes only the empty subset and subset  $\{20\}$ . Both of them are *balanced*.

The last query includes the empty subset and the subsets  $\{20\}$ ,  $\{20\}$  and  $\{20, 20\}$ . Only  $\{20, 20\}$  is *unbalanced*, its sum is  $40$ . Note that you are asked to choose a multiset, thus it might include equal elements.
